

Kandy for the ears

Kandy's brand new, MkII 115 watts per channel, integrated amplifier is jam-packed with the same essential technologies as its predecessor, but is even better. Kandy has surprised even itself with the level of improvement. Layout of circuitry and virtually every component in the original model have been given a thorough going over, and have been improved beyond all expectation.

The power amplifier section of this amazing integrated amplifier utilises two identical mono modules with high performance front-end transistors, drivers, output MOSFETS and coupling capacitors. Improved power supply components include high efficiency fast rectifier diodes, main reservoir capacitors and de-coupling capacitors to ensure optimum performance of the entire amplifier.

The preamplifier section uses four high-performance OP-Amps and provides a fully buffered tape output. The amp's phono input benefits from improved distortion, noise and frequency response. A new high-quality motorized volume control, input/output relays,

RCA inputs and speaker binding posts all preserve signal quality from start to finish.

The new Kandy manages to upstage its older sibling, with much lower distortion levels, higher dynamic range, better resolution, sound stage and rhythm. Kandy's powerfully articulate and tight bass, and its open involving midrange with extended sweet high frequency, provides a coherent musical experience that will satisfy the most demanding listener.

The sweetest Kandy for the most discerning ears.
